ISBN: 97884938108-6-3

Genre: Others

SPRING

2011

Season: SPRING 2011

The Virtual Encyclopedia of the car is a new concept: an encyclopaedia in which the user not only consults the information, but can also interact with the content due to its the electronic format. It offers a broad, general understanding of the systems and mechanisms which make up the contemporary car, covering such topics as: engines, transmission systems, electronic equipment, fuel feed, ignition etc. Apart from its daring but user-friendly design, the main characteristic of this electronic book is its large number of interactive animated diagrams, such as the spectacular 3D videos which faithfully portray the mechanics of a vehicle. These animations offer an understanding of both the assembly process and the the functioning of the various elements which make up the car.
